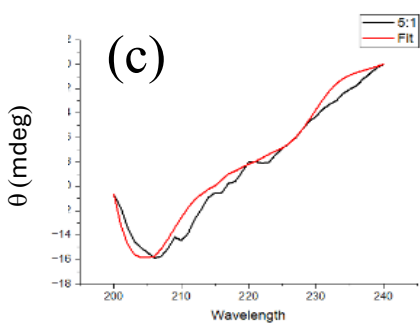

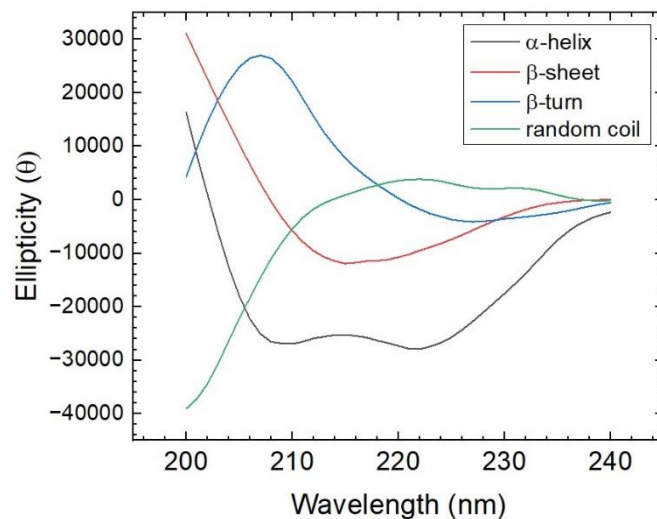

**Figure S1.** Mean residue ellipticity (MRE) results of E2-35 (a, b and c), E2-53R (d, e and f) and LE-54R (g, h and i) in G(-)IM, G(+) and Euk33 LMM ULVs. E2-35 data were adapted from our previously published paper<sup>45</sup> with permission.

**Figure S2.** % Structural motifs vs. lipid/peptide molar ratio of E2-35 (**a, b and c**), E2-53R (**d, e and f**) and LE-54R (**g, h and i**) in three different LMM ULVs. Standard deviations represent 3-4 fitting results using shape analysis. E2-35 data were adapted from our previously published paper<sup>45</sup> with permission.

**Figure S3.** % Structural motifs (in table) for three different fits of the four secondary structural motifs shown above right from Ref. 67 to G(-)/LE-54R (5:1). (a) No weighting. (b) Weighted x10 at 200 and 240 nm. (c) Weighted x10 at 200, 220 and 240 nm. Levenberg/Marquardt fitting routine in Origin Pro 2024 was used to fit the data to the four literature secondary structural motifs. Averages and standard deviations were calculated from several fitting attempts for the same sample's ellipticity.

Tables S1 – S6 summarize secondary structural results (%  $\alpha$ -helix,  $\beta$ -sheet,  $\beta$ -turn and random coil) for E2-53R and LE-54R peptides in three LMMs.  $R^2$  indicates the goodness of fit.

**Figure S4.**  $|F(q_z)|$  for G(-) IM LMMs (a – d), G(+) LMMs (e - h) and Euk33 LMMs (i - l) in the presence of E2-35, E2-53R and LE-54R. The red points are experimental data, and the black line is the SDP model fit to the data. Lipid/peptide molar ratio is 50:1. E2-35 data are at lipid /peptide molar ratio of 75:1 and adapted from our published paper<sup>45</sup> with permission.
